Top 20 Most Used Aircraft Types

Distribution by number of operations

The global skies are predominantly navigated by a diverse fleet of aircraft, with the Airbus 320 and Boeing 738 emerging as the most frequently utilized models by a significant margin. The top 20 list showcases a mix of narrow-body workhorses like various iterations of the Airbus A320 family (319, 320, 321) and the Boeing 737 family (738, 73H, 737, 73W, 733), which form the backbone of many airline operations for short-to-medium haul routes.

Also featured are larger wide-body jets such as the Boeing 777, 763, 330, and 332, typically deployed on longer routes, alongside regional aircraft like the CRJ, E90, AT7, and DH4, crucial for connecting smaller airports and operating regional routes.
